Description:

In the tradition of *The Power of Habit* and *Thinking, Fast and Slow* comes a practical, playful, and endlessly fascinating guide to what we really know about learning and memory today—and how we can apply it to our own lives. From an early age, it is drilled into our heads: Restlessness, distraction, and ignorance are the enemies of success. We're told that learning is all self-discipline, that we must confine ourselves to designated study areas, turn off the music, and maintain a strict ritual if we want to ace that test, memorize that presentation, or nail that piano recital. But what

if almost everything we were told about learning is wrong? And what if there was a way to achieve more with less effort? In *How We Learn*, award-winning science reporter Benedict Carey sifts through decades of education research and landmark studies to uncover the truth about how our brains absorb and retain information. What he discovers is that, from the moment we are born, we are all learning quickly, efficiently, and automatically; but in our zeal to systematize the process we have ignored valuable, naturally enjoyable learning tools like forgetting, sleeping, and daydreaming. Is a dedicated desk in a quiet room really the best way to study? Can altering your routine improve your recall? Are there times when distraction is good? Is repetition necessary? Carey's search for answers to these questions yields a wealth of strategies that make learning more a part of our everyday lives—and less of a chore. By road testing many of the counterintuitive techniques described in this book, Carey shows how we can flex the neural muscles that make deep learning possible. Along the way he reveals why teachers should give final exams on the first day of class, why it's wise to interleave subjects and concepts when learning any new skill, and when it's smarter to stay up late prepping for that presentation than to rise early for one last cram session. And if this requires some suspension of disbelief, that's because the research defies what we've been told, throughout our lives, about how best to learn. The brain is not like a muscle, at least not in any straightforward sense. It is something else altogether, sensitive to mood, to timing, to circadian rhythms, as well as to location and environment. It doesn't take orders well, to put it mildly. If the brain is a learning machine, then it is an eccentric one. In *How We Learn*, Benedict Carey shows us how to exploit its quirks to our advantage.

There's plenty of information here to work with. How to be a better learner seems to be a big trend in recent books. In the past couple of months I've read *Fluent Forever* (about language learning) and *A Mind For Numbers* (about being a good student, particularly in math and science) and they've all been released at the same time. They're also all, I'm very happy to say, strongly grounded in real research, rather than just making up some interesting-sounding notions about what might work (I have certainly seen books that did that...) I would have to say that someone who wants to be a great student ASAP is probably better off reading *A Mind For Numbers* first. That book takes you by the hand and leads you through the ideas about what you need to DO a lot more specifically. It makes very frequent references to research, but it's plainly written with the intention of being a guide for people who are taking and really need to hone in on exactly what to do NOW, because there are tests coming up. It leads you through the material by the hand, pretty much, asking you questions and reminding you to stop and think about what you've read. It also has a (free) online MOOC through Coursera to go with it that covers/reinforces the same material. *Fluent Forever*, in its effort to teach people how to learn languages, makes use of some of the same research, but shapes it to its topic. It offers a sort of general idea of how you should proceed, but the emphasis is on giving you a basic plan and just enough understanding of the research so that you can make good decisions about how to move forward with it. I feel like *How We Learn* is a little farther down the spectrum in that same direction. Most of its emphasis is on teaching you the research (some of which is the same research cited by the other two), with an assumption that you'll be able to make reasonable decisions about how to put it into practice. So he goes over exactly why it is NOT a good idea to learn a new math trick by doing 50 problems in a row that use that trick. He touches on how it can be put into practice, but it isn't something he dwells on. This vs *A Mind for Numbers* is sort of like... one being a professor who teaches key points but assumes that the students are capable of drawing some reasonable conclusions on their own, and the other being a professor who strives to touch on every single possible issue that might be of importance. It's a very different style. For someone who's actually writing a paper on learning or something of that nature, I suspect this will be more valuable. For someone who is actively taking classes or trying to learn a language, I'd say read either *A Mind for Numbers* or *Fluent Forever* first, because they'll get you going on making progress faster. Then, it certainly wouldn't hurt to come back to review some of the concepts and generally deepen your understanding overall by reading *How We Learn*. (If you're not taking classes and you just love teaching yourself new things, you might want to skip *A Mind for Numbers*. It puts a lot of emphasis on things like dealing with procrastination, which is very valuable, but not really a core issue if you're learning for pleasure and there aren't really any deadlines to speak of.)
